Notes on Planting -

Plant the trees immediately upon arrival if possible. If the plants should come to you in a rather dry condition it may be well to immerse the roots in water before planting. We pack to have the plants arrive in good condition, but they may be delayed in transit or subjected to over-heating which is beyond our control after they leave our hands. If soil is too wet for immediate planting, heel the trees in - temporarily plant - in another location, or unwrap the package and inspect the trees to see if they are sufficiently moist, add water to the packing material if necessary, then rewrap and store in a cool cellar until weather permits planting.

DISTANCE TO PLANT. Filberts for screen hedge, 6 ft. apart. In orchard formation about 25 ft. apart. Chestnuts in orchard planting about 40 ft. apart for the permanent planting.

Dig holes large to allow the roots to rest in a natural position. Use a good top soil to fill in and tamp the earth solidly about the roots. Don't use manure or coarse material about the roots. Don't put fertilizer in immediate contact with the roots. When the soil has been filled in to within three inches of the surface, you may use from one to several buckets of water around the tree, depending on the size of the tree and the amount of water required to soak to the bottom of the tree roots. When the water has soaked in, fill in the balance of soil, leaving a depression of about an inch around the tree, shaped like a saucer, so that rain water will collect to the tree rather than run away. Plant about the same depth as the tree stood in the nursery, or not more than one inch deeper.

Pruning the tree. If you have not requested this done at the nursery, trim your tree to balance the loss of fine hair roots and to force new growth on the tree. (If tree is planted in fall, let stand as planted and remove the top in early spring before growth starts. If planted in spring, trim tree as soon as planted.) Remove any undesirable branches, and cut off about 1/3 of the previous season's growth. With filberts, trim the side branches back so that an outside bud is left to make the main growth again. This will give a better shape to the plant than to have the branches grow toward the center.

Training the Chinese chestnut tree. This should be trained with a low head similar to a low-headed apple tree. In planting small trees, usually the side branches are all that is necessary to trim off, leaving a straight stem for planting.
